<b>Description</b> Good Afternoon,  I have installed eXtplorer version <b>2.1.6</b> and I found an issue that I need your help in order to fix this security hole.  <b>When the issue happen:</b> 1 - Using an admin account, create a subfolder in the root folder (any name); 2 - Create a new user, and select his "Home directory" as the new created above; 3 - Now, delete de new created folder that was set to the new user (using admin account still) 4 - Login with the new user and get access to the entire public_html folder!  Are you able to help me to identify where can I insert a folder lookup for each user, and if that folder does not exist, set the User Home directory to some "custom" folder?  Thank you in advance.
