Target version:	2.1.0	
eXtplorer Version:		
		Joomla! Version:
Description		
Jeg arbejder på mac. Den installeres succesfuldt i 1.7, den nyeste versin, men når man vil åbne den, vises fejlen: Warning: require_once() [function.require-once]: open_basedir restriction in effect. File(/usr/local/lib/php/PEAR.php) is not within the allowed path(s): (/var/www/sportshistorie.dk/:/var/www/tmp/) in /var/www/sportshistorie.dk/public_html/administrator/components/com_extplorer/libraries/FTP.php on line 33 Warning: require_once(/usr/local/lib/php/PEAR.php) [function.require-once]: failed to open stream: Operation not permitted in /var/www/sportshistorie.dk/public_html/administrator/components/com_extplorer/libraries/FTP.php on line 33 Fatal error: require_once() [function.require]: Failed opening required 'PEAR.php' (include_path='.:usr/local/lib/php') in /var/www/sportshistorie.dk/public_html/administrator/components/com_extplorer/libraries/FTP.php on line 33 Ved du hvad det skyldes? Tak for et ellers uundværligt værktøj ;-) Mvh Maisen

Found the bug - also present in Joomla 2.5.1 when open_basedir is in effect:

In the file <root>/administrator/components/com_extplorer/libraries/FTP.php, the include statement must be altered to:

```
/** * Include PEAR.php to obtain the PEAR base class
*/
require_once dirname(FILE).'/PEAR.php';
```

By adding the dirname() (and the slash before PEAR, the PEAR.php file is found, and the eXtplorer component works as a charm - couldn't live without it :-)

Best Regards
Lars

Aarrghhhh!!!
Formatting removes vital information ...

Must be:

```
require_once dirname(__FILE__).'/PEAR.php';
```

/Lars

#3 - 03/29/2012 02:43 PM - Sören Eberhardt-Biermann

- Status changed from Neu to Erledigt
- Target version set to 2.1.0

Thanks for the solution!
