Description		
I think that JSON response should allways be application/x-javascript. For example action=upload is not. Why? Some hosting companies adds extra content with javascript statistics code when response content-type is text/html, so JSON response could not be properly parsed and error occurred. My quickfix: --- a/admin.extplorer.php ++ b/admin.extplorer.php <u>@ -110.6 +110.7 @ if(file_exists(EXT_PATH . '/include/'. strtolower(basename(\$action)) . '.php</u> <u> }</u> <u>\$classname = 'ext.\$action';</u> <u>if(class_exists(strtolower(\$classname)) && is_callable(array(\$classname.'execaction'))) {</u> header("Content-Type: application/x-javascript"); \$handler = new \$classname(); \$handler->execAction(\$dir, \$item); } else { Joomla! 1.5.19 PHP 5.2.17
